Google	Computer Science	4	False	<button>Update</button> <button>Delete</button>

Updated rating as 4

HW4 REPORT

Mongo db updated.

Challenges :

1. Converting all the routes to be able to connect to database
2. Adding routes and writing catalog controller with async functions
3. Getting data from the database
4. Presenting views appropriately with the data we get from the model
5. Handling errors in the URL and routing to appropriate pages.

How I overcome:

Status:

Currently, all the pages are loaded dynamically using the EJS templates and using session to store the state of the user

Currently all the changes are reflected in the db

Login is implemented and when saved item and rate item button clicked without login, I am redirecting to myitems page and login
